

Week 8 – Hero Prototype

Introduction

For this project, our team focused on improving the student course registration process. Many students experience difficulties when trying to find available courses and plan their schedules for future semesters. The current process can sometimes be confusing, and students often need to meet with advisors just to understand which courses they should take.

Our team decided to design a simplified system that helps students easily view available courses and organize their schedule for the semester. The goal of the system is to make the registration process clearer, faster, and more convenient for students.

Hero Prototype Definition

The hero prototype for Week 8 demonstrates a simplified student course planning workflow. The goal of this prototype is to help students explore available courses and build their semester schedule in a simple and organized way.

Instead of relying heavily on advisors for basic planning, students can use the system to review available courses, check their schedules, and identify potential conflicts before registration. This makes the process more efficient and easier for students to manage.

Prototype Workflow

The prototype demonstrates the following steps:

1. A student profile is created in the system where basic student information is stored.
2. Course schedules are displayed in a calendar-style view.
3. The student can browse and view possible courses for the upcoming semester.
4. The system helps identify scheduling conflicts between selected courses.

5. Notifications or messages can be sent to students to inform them about updates or important information.

Why This Prototype Demonstrates System Value

This prototype demonstrates how the system can improve the course planning process for students. One of the main problems identified during our research was that students often struggle to find course lists and organize their schedules.

The system helps solve this problem by presenting course information and scheduling tools in one place. Students can clearly see their course options, compare schedules, and avoid conflicts before registering.

Overall, the prototype shows how a simplified system can make course registration easier and help students plan their academic schedule more efficiently.
