1. Problem Statement

Many National Louis University undergraduates have difficulty registering for classes and planning their degree programs because of the fragmented nature of the current systems, which require a high degree of advisor involvement. Students have limited access to information about degree requirements, do not have the ability to independently track completed coursework, or plan for their future semesters.

2. User Requirements

UR1: Students need to view all degree requirements for their academic program in one place.

UR2: Students need to track completed courses and see which courses remain for graduation.

UR3: Students need to receive recommendations for the next courses they should take based on prerequisites and program requirements.

UR4: Students need to generate a conflict-free schedule for upcoming semesters.

UR5: Students need to register for courses independently without relying heavily on advisors.

UR6: Students need to be alerted when there are prerequisite conflicts or scheduling problems.

3. System Requirements

FR1: The system must display a student's academic program and degree requirements.

FR2: The system must track completed courses and automatically update the student's progress toward graduation.

FR3: The system must recommend courses based on program requirements, completed coursework, and prerequisites.

FR4: The system must detect scheduling conflicts between selected courses.

FR5: The system must generate a conflict-free course schedule for the student.

FR6: The system must allow students to register for selected courses directly through the platform.

FR7: The system must notify students of prerequisite issues or missing requirements before registration.

4. Non-Functional Requirements

NFR1 – Reliability:

The system must operate consistently without system crashes during peak registration periods.

NFR2 – Performance:

The system must load student degree information and course schedules within three seconds.

NFR3 – Security:

The system must protect student academic records and personal information through secure authentication and data protection.

NFR4 – Availability:

The system must be accessible to students 24 hours a day during registration periods.

NFR5 – Usability:

The system interface must be simple and intuitive so that students can navigate course planning without technical assistance.
